

HisabDo Capstone — Test Plan

SQA Track | Day 8 Capstone Project | Mobile App & Website

Product Tested: HisabDo — Android App (com.usman.hisabdo) & Website (hisabdo.app)

Program: HisabDo SQA Internship — Day 8 Capstone Project

1. Introduction

This document defines the test strategy for the HisabDo Capstone Project QA phase, covering both the HisabDo Android mobile application (Google Play package com.usman.hisabdo) and the HisabDo marketing/support website (hisabdo.app). It was prepared after directly reviewing HisabDo's official website (Home, About, FAQ, Contact, Founder pages) and its Google Play Store listing to ground every section in the product's actual, documented feature set rather than assumptions.

2. Scope

Testing covers two components of the HisabDo product:

- HisabDo Mobile App (Android, Google Play: com.usman.hisabdo) — an offline-first khata/ledger app for tracking udhar, receivables, payables, customer accounts and expenses.
- HisabDo Website (hisabdo.app) — the public marketing, informational and support site, including Home, About, FAQ, Contact, Blog, and Founder pages.

In scope: core khata/ledger functionality, customer management, transaction recording (including voice entry), PDF export & sharing, analytics, backup & restore, multi-language and multi-currency support, app security (biometric/PIN lock), and all public-facing website pages and navigation.

3. Testing Objectives

- Verify that core financial record-keeping (money given, money received, expenses, balances) is accurate and consistent, especially fully offline.
- Confirm the app functions correctly without an internet connection, per its offline-first design.
- Validate that customer, transaction, backup and PDF-export workflows behave as documented on the official website and Play Store listing.
- Ensure the UI is clean, consistent and usable by the app's target audience — shopkeepers, freelancers and small business owners who may not be highly technical.
- Confirm the website accurately represents the app, all navigation and download links work, and content displays correctly across devices.
- Establish a baseline regression suite that later development cycles can be tested against.

4. Features to be Tested

Mobile App

- Onboarding — language selection, currency selection, first-run experience
- Dashboard — receivables, payables, and cash position overview
- Customer Management — add/edit/view customer profiles and balances
- Transactions / Khata Ledger — record money given, money received, expenses, and notes
- Voice Entry — record a transaction by speaking
- PDF Export & Sharing — generate and share statements (WhatsApp, email, etc.)
- Analytics — income trends, expense patterns, outstanding balances
- Backup & Restore — to device storage, SD card, or cloud
- Multi-Language — Urdu, English, Hindi, Arabic, Roman Urdu (including RTL rendering) • Multi-Currency — PKR, USD, INR

- Security — biometric/PIN app lock
- Built-in Calculator

Website

- Home page — hero, feature sections, download CTA, stats, FAQs preview
- About App page — feature narrative and screens
- FAQ page — expandable Q&A content
- Contact page — support email links
- Blog — article listing and individual posts
- Founder profile page
- Site-wide navigation, footer, and social media links
- Responsive layout across desktop/tablet/mobile viewports

5. Features Not to be Tested

- iOS application — HisabDo is currently Android-only; no iOS build exists to test.
- Backend/cloud infrastructure internals (e.g. Supabase) — only the app-facing behavior of optional sign-in/backup features is tested, not backend implementation.
- Third-party delivery of WhatsApp/SMS/email messages once shared — only that the app successfully triggers the native share/send action is tested.
- Play Store review, rating, and listing management processes.
- Content or functionality of external social media pages (Facebook, Instagram, TikTok, YouTube, LinkedIn) — only that links from the site open correctly.
- Payment gateways or in-app purchases — none are documented as part of the current app.
- Load/stress testing at production scale (multi-thousand concurrent users) — out of scope for a capstone-level QA pass.

6. Test Types & Strategy

6.1 Functional Testing

Validate that each core feature performs its intended function: adding/editing/deleting customers and transactions, correct balance calculations (receivables/payables/cash position), PDF generation with accurate data, backup and restore integrity (data matches before/after), and correct behavior of voice entry, calculator, and language/currency switches. Website functional testing covers navigation links, download/CTA buttons, and mailto/contact links.

6.2 UI Testing

Verify layout, alignment, iconography, color contrast and readability across the app's key screens (Dashboard, Customer list, Transaction entry, Analytics, Settings) and the website's key pages. Special attention to right-to-left (RTL) layout correctness when Urdu or Arabic is selected, since this is a documented supported language pair likely to expose layout bugs.

6.3 Usability Testing

Since HisabDo's target users include non-technical shopkeepers, usability testing focuses on: how quickly a new user can add their first customer and transaction, clarity of error/validation messages, discoverability of voice entry and PDF export, and overall navigation simplicity without training.

6.4 Compatibility Testing

The Play Store listing states a minimum of Android 6.0, with Android 8.0+ recommended. Compatibility testing should cover a spread of Android OS versions (6, 8, 10, 12, 14+), a range of screen sizes (small phone, large phone, tablet), and at least two device manufacturers (e.g. Samsung, Xiaomi/Redmi) to catch OEM-specific rendering issues. Website compatibility testing covers Chrome, Firefox and Edge, plus mobile browser rendering.

6.5 Regression Testing

After every new build or website deployment, re-run a core regression subset: login/onboarding, add customer, add transaction (all three types), balance accuracy, PDF export, backup & restore, and the website's Home/About/Contact pages and download link. This subset is deliberately small enough to run every build while covering the app's most business-critical paths.

6.6 Performance Testing

Measure and validate: app cold-start time, transaction list scroll/render performance once a customer has a large transaction history, PDF generation time for a statement with many entries, backup/restore duration, and responsiveness while fully offline (since offline-first is a core, marketed differentiator, any perceptible lag here is a high-priority finding). On the website, measure page load time for Home and About pages.

6.7 Security Testing

Validate that the biometric/PIN app lock correctly restricts access, that core financial data remains on-device as documented (no unexpected network calls when the app is used fully offline), that backup files are only written where the user directs them, and that restoring a backup does not expose or corrupt another user's data. Also confirm the app correctly handles the documented minimum-age guidance (not intended for children under 13) at a policy/informational level, and that the website's outbound links (Play Store, social, mailto) point to legitimate, expected destinations rather than being spoofed or broken.

7. Test Environment

- Mobile: Physical or emulated Android device(s), Android 6.0–14, HisabDo installed from Google Play (com.usman.hisabdo)
- Website: Desktop browsers (Chrome, Firefox, Edge) and mobile browser emulation, testing <https://hisabdo.app> and its subpages
- Network conditions: both fully offline and online, given the app's offline-first design

8. Entry & Exit Criteria

Entry Criteria

- Latest stable build of the HisabDo app is installable from Google Play (or a provided test build/APK)
- Website is deployed and publicly reachable at hisabdo.app
- Test cases and test data are prepared and reviewed **Exit Criteria**
- All planned test cases have been executed (or explicitly marked Blocked/Not Executed with a reason)
- No open Critical or High severity defects remain unresolved
- Test Execution Summary and bug reports are documented and shared with the team

9. Deliverables

- This Test Plan
- 20+ Mobile App test cases (Test_Cases_Mobile.docx)
- 10+ Website test cases (Test_Cases_Website.docx)
- Bug reports for any defects found during execution
- Test Execution Summary once test cases are run

10. Notes on Methodology & Honesty

This Test Plan and the accompanying test cases were prepared by directly reviewing HisabDo's live website content (Home, About App, FAQ, Contact, Founder pages, fetched and verified on 2026-08-09) and its Google Play Store listing. The mobile app itself was not installed or executed as part of preparing this document, since no Android device/emulator is available in this environment — mobile test cases are written from the app's documented, marketed feature set and are ready to execute,

but their Status fields are marked 'Not Executed' until run on a real device. Website test cases that reference directly-fetched pages are marked as verified.
