

Test Execution Summary - HisabDo Day 7 SQA Internship

Applications Under Test: saucedemo.com (Web) · dummyjson.com (API) **Testing Types Covered:** Functional, UI, Form Validation, Positive, Negative, Boundary, API, Usability, Cross-Browser **Tools Used:** Chrome / Edge / Firefox (manual web testing), Postman (API testing)

1. Overall Test Case Coverage (Planned)

Source	Test Cases
TestCases/Web_Test_Cases.xlsx	50
APICollection/API_Test_Cases.xlsx	20
Total Planned Test Cases	70

2. Executed Test Cases (With Screenshot Evidence)

Category	Count
Positive test cases executed	17
Negative test cases executed	12
Total executed with evidence	29

3. Result Breakdown (Executed Set)

Result	Count	Notes
Passed	29	Application behaved exactly as expected, including all negative and boundary scenarios
Failed	0	No confirmed defects found in this cycle
Blocked	0	No test cases were blocked by environment/setup issues
Total	29	

4. Bugs Found

Severity	Count
Critical	0
High	0
Medium	0
Low	0
Total Bugs	0

Full details: [BugReports/Bug_Reports.md](#). (Two items were initially suspected as bugs during API negative testing but were re-reviewed and confirmed to be expected 404 behavior, not defects — documented in the Bug Reports file for traceability.)

5. Module-Wise Execution Status

Module	Test Cases Executed	Passed	Failed
Login	5	5	0
Inventory / Product Listing	5	5	0
Cart	4	4	0
Checkout	7	7	0
API – Products/Categories/Automation	8	8	0

Note: all 8 API cases passed, including the 4 negative/boundary cases (AP1001-N1..N4) — each correctly returned a not-found response for an invalid product ID or unmatched route, which is the expected behavior for those inputs.

6. Test Environment

- Browsers:** Chrome (primary), cross-browser pass planned for Firefox and Edge per [Web_Test_Cases.xlsx](#) (TC048-TC050)

- **API Client:** Postman
- **Network:** Stable broadband connection
- **Web App Under Test:** <https://www.saucedemo.com>
- **API Under Test:** <https://dummyjson.com>

7. Key Observations

- Core user flows (login, browse products, add/remove from cart, checkout, order confirmation) all function correctly and consistently across every screen tested.
- Form validation on both Login and Checkout is consistent and user-friendly, always naming the specific missing field.
- API negative and boundary testing (invalid IDs, wrong resource paths) all returned appropriate not-found responses — no defects found in this cycle.

8. Recommendation

Application is stable across its core commerce flow and the API endpoints tested. No bugs identified in this cycle; no release blockers.

Prepared as part of Day 7 – SQA Internship, HisabDo.
